- Umbraco MVP
- Carnatic Music, Reading
- @poornimanayar

Components in Blazor

- Building blocks of Blazor apps

- Razor files with a <mark>.razor</mark> extension. Formally called Razor Components

- Can be a page, a form or a dialog

- Can be nested, reused or even shared among projects

Components in Blazor

- Component names must always start with an uppercase character Mycomponent.razor

- Include a component in a page or another component by using the name of the component as a HTML tag. For e.g. a component called Mycomponent.razor can be called as <Mycomponent></Mycomponent>

- Components compile to partial classes

Routing

C# Code in Components

Parameters

Lifecycle of a Component

SetParametersAsync

Sets the parameters for the component

OnInitialized/ OnInitializedAsync

Upon component init after having received parameters

OnParametersSet/ OnParametersSetAsync

After component init and then everytime after a parameter value changes

OnAfterRender/ OnAfterRenderAsync

After the component has rendered completely

Data Binding

One-Way Binding

Unidirectional flow of updates eg: a label value updated from a property value @PropertyName

Two-way Binding

Bi-directional flow of updates, eg: form @bind=PropertyName on HTML element @bind-<attribute-name> =PropertyName @bind-<attribute-name>:event=on<event-name>

Event Handling

- Events can be specified on HTML elements as attributes of format ==@on{EVENT}==. Value of the attribute treated as the event handler. Eg ==@onclick = "HandleOnClick"==

- Event handlers can be asynchronous and return a Task

- An optional ==EventArgs== can be passed into the event handler . For e.g. ==MouseEventArgs==

Accessing the JavaScript Runtime

Communication between Components
